Glostrup, Denmark, 1st December 2020

Danish companies enter into a partnership for the development and distribution of IoT Security for the industrial market

The security company, Cryptera, and the electronics manufacturer, Micro Technic, have entered into a partnership that combines Cryptera's IoT security solution with Micro Technic's IoT devices and their Cloud based platform for distributing IoT security.

The solution is based on Cryptera's many years of knowledge and technology in development and certification of Security Solutions for the global payment market. By establishing a security layer at the chip level of a given IoT device, one can, through the use of certificates and encryption, establish a "Root of Trust" in the given IoT device. When you combine this security with Micro Technic's IoT devices, which are supported by a Cloud based IoT platform, manufacturers can achieve a level of security that is similar to what is used for financial transactions and payment terminals. At the same time, you can ensure IP protection, communication and continuous SW updates of the device over its life cycle.

"We see the solution and the partnership with Micro Technic as very attractive in terms of addressing the growing demand for security solutions for the Industrial IoT market. We know that security in general is a barrier for many companies, in relation to their further implementation of IoT solutions. Data security is a major focus area for many companies and many are concerned about the level of security in their own solutions, but also 3rd party IoT devices, that are connected to the company's own network. When you combine our security technology and experience with Micro Technic's access to the market, we offer a solution that addresses many of the challenges companies face when working to integrate security," says Cryptera's CEO Brian Schleisner.

"It is evident that the rapidly growing number of IoT solutions in industrial applications has created a lot of sensitive data. With Cryptera's security solution, we want to ensure that the customer's data is not compromised. We manufacture many applications that run on IoT devices, where with this solution we will be able to secure IP rights and protect the application against hostile data attacks. It is quite unique, and we can now secure our customers' IP at a completely different level of security," says Frank Max Laursen, CEO of Micro Technic.

"Micro Technic is proud of our partnership with Cryptera. In addition to a market-leading partner within IoT security, we now have a partner where we in future will develop many interesting projects together. Our customers will benefit from an exceptional IoT security solution supported by a user-friendly IoT platform - and we can deliver it today," adds Frank Max Laursen.
